Education

Riga Technical University Riga, Latvia
Bachelor of Computer Science

Programming School 21 (42 Network) Kazan, Russia
Computer Science *Feb. 2022 – Apr. 2025*

Experience

Software Engineer Jan. 2025 – Present
Positive Solutions LLC *Tashkent, Uzbekistan*

Project Overview: Incard.uz is a large-scale auto-payment platform integrated with over 200 banks, financial institutions, and insurance companies. The system provides automated payment services for recurring financial transactions and offers high availability, scalability, and observability across multiple partner integrations.

- Reduced memory usage by sixfold by integrating new tools with efficient data compression algorithms and optimizing memory-intensive routines.
- Enhanced system observability by integrating advanced logging and monitoring tools; developed custom adapters to seamlessly connect them with the existing infrastructure.
- Integrated the platform with six major partner systems, including banks and fintech services, expanding service functionality and ecosystem reach.
- Implemented new features that improved client handling capacity and transaction throughput, leading to a notable increase in system scalability.
- Decreased the rate of persistent bugs through refactoring legacy components, introducing better error handling, and strengthening testing coverage.
- Contributed to a threefold growth in project revenue by improving stability, integrating new partners, and enabling additional payment channels.
- Optimised resource utilization through profiling, fine-tuning concurrency models, and improving service efficiency.
- Delivered high-performance solutions using Go concurrency patterns, enhancing parallel processing, throughput, and overall system reliability.

Software Engineer Aug. 2023 – Dec. 2024
Uzinfocom LLC *Tashkent, Uzbekistan*

Project Overview 1: Development of a digital health platform based on the HL7 FHIR standard to enable secure and standardized medical data exchange.

- Engineered automation tools for generating FHIR-compliant resource structures, accelerating development and significantly reducing manual coding effort.
- Developed internal utilities and helper methods to simplify manipulation and handling of FHIR resources.
- Performed comprehensive quality control to ensure adherence to clinical and regulatory standards.
- Analyzed development requirements to align platform functionality with client and compliance needs.
- Executed manual testing, including unit, integration, and E2E test scenarios, ensuring robustness and reliability.
- Logged, triaged, and tracked bugs, working closely with cross-functional teams to resolve issues promptly.
- Delivered regular product demos to stakeholders, showcasing progress and collecting actionable feedback.
- Made strategic decisions regarding feature readiness and deployment to maintain project timelines.

Project Overview 2: Development of a digital platform for the Uzbekistan Football Association with integration capabilities for official FIFA projects.

- Designed a scalable, flexible architecture utilizing the plug-in pattern to maximize maintainability and modularity.
- Built a project generator to automate setup phases including architectural boilerplates, documentation, and CRUD service scaffolding.
- Developed and maintained reusable third-party libraries to streamline common backend operations and boost productivity.
- Contributed to the development of high-load backend services capable of supporting large-scale user activity.

Junior Software Engineer Jan. 2023 – Jul. 2023
Uzbekistan Railways JSC *Tashkent, Uzbekistan*

Project Overview: Development of an internal automation and monitoring system for the laboratory, designed to manage the analysis, accounting, and certification of imported products.

- Led the entire backend development from scratch, building a robust and scalable system to handle data analysis, reporting, and certification processes.
- Wrote comprehensive backend code, including custom business logic and database integration, ensuring efficient data handling and processing.
- Developed and implemented unit tests and integration tests to ensure code quality and system reliability.
- Deployed the solution to production, ensuring smooth operation and continuous monitoring.
- Wrote clear, concise, and thorough documentation for both the development process and the system functionality, making it easy for the team to understand and maintain the system.
- Optimized system performance to ensure fast data processing and minimized resource usage, improving overall system efficiency.

Technical Skills

Languages: English, Russian, Uzbek
Programming Languages: Golang, Python, C/C++, SQL (Postgres)
Developer Tools: Git, Docker, NATS, Redis, Kafka, Kubernetes, Postman, Swagger
